

Q. According to Prasanna, what are the superstitions of Yjna? Explain

Science is a great branch of knowledge to understand the physical world. Thousands of scientists have devoted their lives to knowledge and built this branch. Science has solved many problems such as superstitions, mental delusions, etc. Machines are the products of science. Science deserves the respect it justly deserves. It is important that even the machines inherit the inheritance property of the bully son and the knowledge institutes are also knowledge based institutes. Just as religious institutions can become a stumbling block to a devotee due to their over-vegetated state, so also technology has defied all odds. When technology becomes a powerhouse, there is no way to reject technology. Prasanna says that modern technology has reached such an amoral state

worry

The link between technology and industry, research funding and the capitalist education system is dangerous. It is because of this problem that technology has become so useful. The industry is not willing to spend money on research on something useless. The limitation of utility is killing modern science. So, against the superstitions covered by this, science is implementing modern superstitions. Whether it is the propaganda that black skin will become white in just seven days with fairness creams, that the strength of a bull will increase

as soon as you drink some energy water, that using soap products will increase my radiance and give you eternal youth, or that women will become sexier because of shaving lotions, what is this but superstition? . All these are tricks used by multinational pharmaceutical companies, tricks used by arms manufacturers, and stock market tricks are popular. Scientific research funding, scientific analysis and scientific statistics are being misused everywhere. The truth is being twisted. Actors who dress up to sell toothpaste play the role of a scientist telling the truth. Other qualities are falsely attributed to the goods. We are killing the old superstitions by paying at least a small amount. New superstitions are being killed by paying lakhs of rupees. Commodity culture is spreading everywhere and creating this kind of environment is definitely not science. It is not true that we have to reject automatic machines to save science. In this background Ye Prasanna ties his alo chans with great concern.
